1 Introduction

This document tests figure extraction and outlines. The text around each figure is ordinary prose, long enough that every line holds many words.

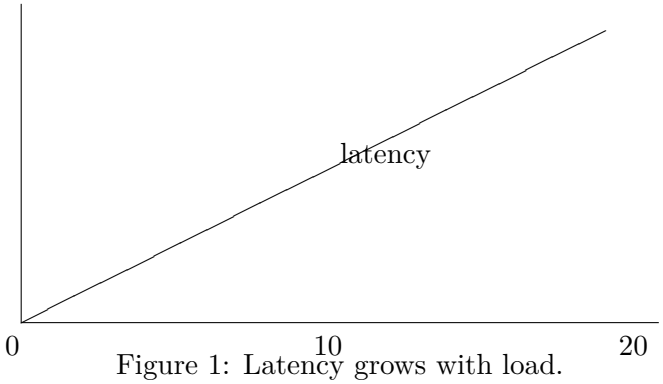

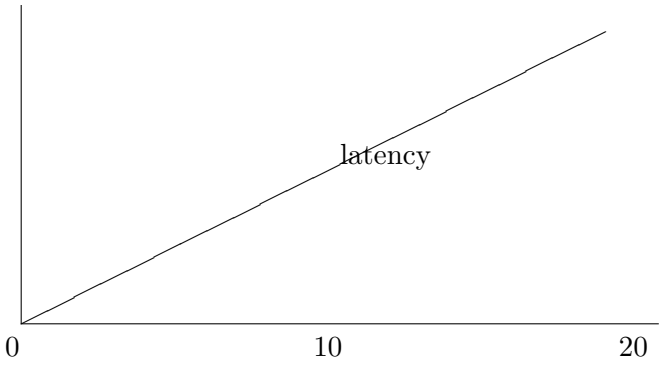

Figure 1: Latency grows with load.

Figure 2 shows the same data from another angle, and this sentence names a figure without being its caption, so it must not be read as one.

1.1 Method details

More prose follows here so that the section has a body of its own, with several words on every line of the paragraph below the heading.

Figure 2: Throughput by node, caption above.

2 Results

The results section closes the document with one more paragraph of prose so the outline has a second top-level entry.
